Summary

From 7 to 25 September 2009, a collaborative exploration between NIAS Genebank and USDA ARS to collect genetic resources in Hokkaidō and the Northern Tōhoku region was performed. The investigated areas were mainly upper deciduous forest and subalpine conifer forest zones. The vegetation was mainly forests, but we also visited upland bogs and coastal vegetation to collect some particular plants. The expedition obtained 147 seed and plant samples representing 20 genera and 53 species. Collected genera were *Actinidia*, *Chaenomeles*, *Corylus*, *Crataegus*, *Empetrum*, *Gaultheria*, *Humulus*, *Fragaria*, *Lonicera*, *Lycium*, *Malus*, *Mentha*, *Prunella*, *Potentilla*, *Pyrus*, *Ribes*, *Rubus*, *Sorbus*, *Vaccinium* and *Vitis*.

Key words: genetic resources, fruit tree, nut, Hokkaidō, Tōhoku

Introduction

Hokkaidō Island occupies a special position in the phytogeography of Japan. In the classification system of the world's floristic regions¹⁾, Hokkaidō belongs to Sakhalin-Hokkaidō Province, while the other three main islands of Japan belong to Japanese-Korean Province. Both Provinces belong to the East Asiatic Region, Boreal Subkingdom, Holarctic Kingdom. Since Hokkaidō is the northernmost island of Japan and its climate is subarctic, it has many more plants in common with the Circumboreal Region (Northeastern Siberian Province, Okhotsk-Kamchatka Province, Canadian Province, etc.) than the other three islands. In addition, several of these plants are also distributed in the Northern Tōhoku region, mainly in the Ōu Mountains

and the Kitakami Mountains²⁾.

The participants from USDA, Kim E. Hummer (KEH), and Joseph D. Postman (JDP), had already explored Eastern Siberia and the Kurile Islands to collect fruit and nut genetic resources, and in 2003 they planned an expedition to Hokkaidō and offered to collaborate with NIAS Genebank. The first Joint Expedition was held in July 2004, mainly to collect *Fragaria*, *Lonicera*, *Ribes* and other small fruit genetic resources which bear mature fruits in this season.

In 2008, American members planned a second expedition to collect *Actinidia*, *Humulus*, *Malus*, *Pyrus*, *Rubus*, *Sorbus*, *Vaccinium* and so on, the fruits of which ripen later than July. A non-funded cooperative agreement between NIAS Genebank and USDA ARS was drawn up, in accordance with the Bonn Guidelines on Access to Genetic Resources and Fair and Equitable Sharing of the Benefits Arising out of their Utilization.

Methods

The main purpose of this exploration was to collect mature seeds of wild genetic resources, and so it was important to find their native habitats. However, it is difficult to obtain detailed location information from publications (scientific reports, flora, field guides, etc.), so we started by gathering such knowledge from primary information sources, mainly herbarium specimens and personal communications with local botanists.

Then we narrowed down candidate locations, selected several public forests and applied for permission to explore. For locations situated in special zones of national parks or quasi national parks, which are controlled by government regulations, we also applied for permission under those regulations. We also planned to collect from materials cultivated in botanical gardens and other facilities, since wild plants do not bear fruit every year.

For these purposes, Japanese members, Hiroyuki Iketani (HIk), Hiroyuki Imanishi (HIIm) and Nobuko Mase (NM), carried out preliminary field investigations in August 2008 (HIk), June 2009 (HIk and NM) and August 2009 (HIk and HIIm). We finally planned the itinerary (Table 1), and the main investigation was conducted by both American (KEH and JDP) and Japanese (HIk and HIIm) members from 8 to 25 September 2009.

Results and Discussion

A total of 147 accessions of genetic resources representing 20 genera and 53 species were collected (Table 2), of which 29 were plant samples (living plants or cuttings) and 124 were seed samples. These samples were divided between the NIAS Genebank and USDA ARS collaborators. The Japanese portion was deposited in the Genebank of NIAS, and the US portion was deposited in the US/NPGS.

Particularly interesting plants are outlined below.

1) *Crataegus chlorosarca* (including *C. jozana*)

This species is listed in the National Red List of endangered plants³⁾ as “vulnerable” (= high risk of endangerment). It might have been a common species in the lowland swamps of Hokkaidō before reclamation began in the mid 19th century, but this habitat has greatly decreased and it is now difficult to find this species. Our investigation location, a national forest in Nanporo-chō, was originally a natural forest. It remains as a windbreak forest, although the

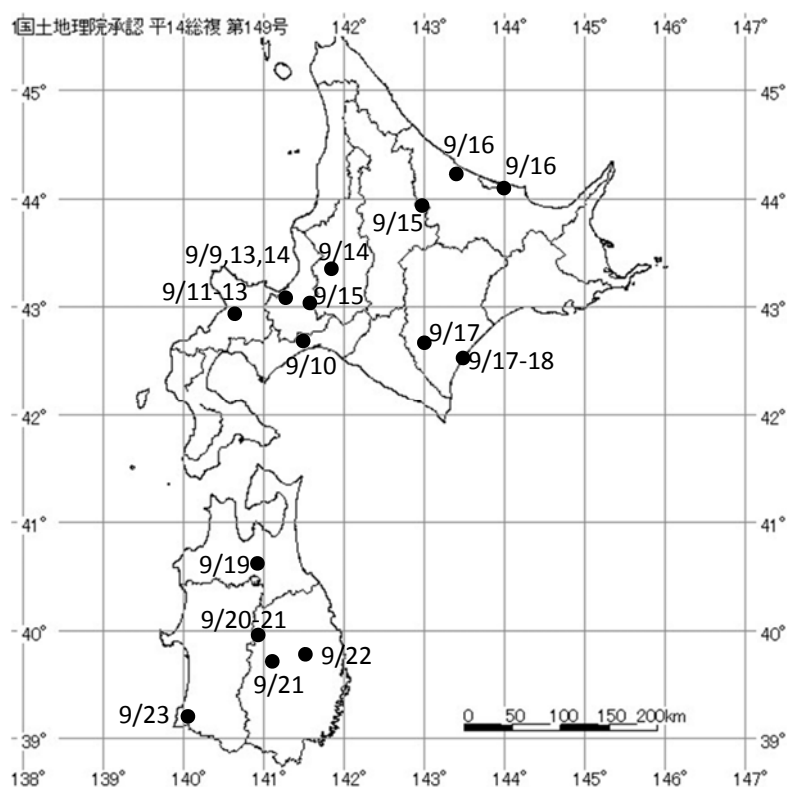

Fig. 1. Collection sites of genetic resources. The map was made with KenMap¹³⁾.

Table 1. Itinerary of the main investigation from 8 to 23 September 2009.

Date	Principal locality	Main purpose
2009/9/8	Arrival at Sapporo (All members)	
2009/9/9	Botanical Gardens, Hokkaido University (AM), Hokkaido Agricultural Research Center (PM)	Cultivated plants (originally collected in Hokkaidō)
2009/9/10	Tomakomai University Forest of Hokkaido University	
2009/9/11	Move to Niseko-chō (AM), around the foot of Mt. Nisekoannupuri (PM)	<i>Vaccinium</i> and other alpine plants
2009/9/12	North foot of Mt. Konbudake (AM), Shinsennuma Bog, Niimitōge Pass (PM)	<i>Rubus vernus</i> and other alpine plants
2009/9/13	Private gardens in Kucchan-chō (AM), Sapporo-shi	Cultivated plants (originally collected in Hokkaidō)
2009/9/14	Forest and Forest Products Research Institute (AM), Hokkaido Forestry Research Institute (PM)	Cultivated plants (originally collected in Hokkaidō)
2009/9/15	Nanporo-chō (AM), Ukishima Shitsugen Bog (PM)	<i>Crataegus</i> , <i>Vaccinium</i>
2009/9/16	Monbetsu-shi (AM), Lake Saromako (PM)	<i>Vaccinium</i> , <i>Malus</i>
2009/9/17	East foot of Hidaka Mountains (AM), seashore of the Pacific Ocean (PM)	<i>Mentha</i>
2009/9/18	Hidaka-shichō (AM), move to Sapporo	
2009/9/19	Move to Aomori (KEH, JDP and Hik), north foot of Hakkōda Mountains	<i>Rubus vernus</i>
2009/9/20	East foot of Mt. Ōdake (AM), Mt. Hachimantai (PM)	<i>Vaccinium</i> , <i>Prunella</i>
2009/9/21	East foot of Mt. Hachimantai (AM), Morioka-shi (PM)	<i>Sorbus</i> , <i>Prunella</i>
2009/9/22	Kitakami Mountains	<i>Malus</i> , <i>Pyrus</i>
2009/9/23	Mt. Chōkaisen, move to Tsukuba	<i>Rubus vernus</i> , <i>Vaccinium</i>
2009/9/24	NIFTS and NIAS at Tsukuba	
2009/9/25	Return to U.S. (KEH and JDP)	

surrounding area has been developed as agricultural land. As a result, the forest has become a refuge for native rare plants and has retained species richness, while other windbreaks, typically secondary forest, have not done so.

2) *Lycium chinense*

We found a small population near the seashore in Minatomachi, Rankoshi-chō. This plant is common in human areas except for Hokkaidō, where it is very rare. It is found only in the southern area where Japanese people had already settled before the mid 19th century, so it is thought to have been introduced from Honshū.

3) *Malus baccata* var. *mandshurica*

Unlike its distribution in the upper mountainous zone (1,000 - 2,000 m asl.) in Central Honshū⁴⁾, in Hokkaidō it appears in coastal sand dune forests, especially in the Okhotsk Sea area⁵⁾. In other areas we found only a few individuals through preliminary field investigations and this forest type may have decreased, so we chose to visit Lake Saromako where a large population was found.

4) *Rubus vernus*

This is an endemic species distributed from Central Honshū and the Northern region, mainly on the Sea of Japan side. In Hokkaidō it is very rare and found only in the southern area. However, since it grows in upper mountainous and subalpine zones, it is native unlike *Lycium chinense*. The northern limit is Mt. Shakotandake⁶⁾. We investigated a small population on Nimitōge Pass in the Niseko Mountains.

5) *Sorbus x kawashiroi*

This is a natural hybrid between *Sorbus alnifolia* and *S. commixta* originally discovered in the Okhotsk area⁷⁾. We collected samples from a cultivated tree in the Botanical Gardens of Hokkaidō University that had perhaps been propagated from an original individual.

6) *Pyrus ussuriensis*

This formerly ambiguous species was recently proved to be truly native to the Kitakami Mountains⁸⁾ in Iwate Prefecture, however, the extant populations are very small⁹⁾. It was listed in the National Red List of endangered plants³⁾ as “critically endangered” (= extremely high risk of extinction). Most recently, the majority of individuals were proved to be introgressed with *Pyrus pyrifolia*¹⁰⁾. Therefore we selected several trees having the true native genetic structure from the data in reference 10 and collected from them.

Future prospects

Through the two collaborative explorations we were able to collect many native wild fruit tree genetic resources from Hokkaidō. We will evaluate the characteristics of the collected germplasms in parallel with maintaining and propagating them. These will be valuable materials for evolutionary biology, ecology, and physiology studies, as well as horticulture and breeding.

Acknowledgements

We would like to thank Dr. H. Nakai of Sapporo city, Mr. H. Igarashi of Chitose city, Mr. Y. Ueno of Shiroishi city, Mr. Y. Horii of Daisen city, Mr. N. Numakunai of Fukushima city, Dr. T. Azuma of the Botanical Gardens of the Graduate School of Agriculture, Hokkaidō University,

Dr. Y. Ito of the National Agricultural Research Center for the Hokkaidō Region, Mr. I. Ikeda of Niseko town, owners of two private gardens in Kucchan town, Dr. T. Kawahara of the Hokkaidō Research Center, Forestry and Forest Product Research Institute, Dr. Y. Wakita of the Hokkaidō Forestry Research Institute, Hokkaidō Research Organization, Mr. M. Takahashi of the Central Agricultural Experiment Station, Hokkaidō Research Organization and Dr. M. Suzuki of Iwate Prefectural Museum, for providing information on the native habitats or guiding and permitting us to collect in their institutions. We are grateful to the curators of the herbarium of the Botanical Gardens of the Graduate School of Agriculture, Hokkaidō University for assisting us with our investigation of plant specimens. We are also grateful to District Forest Offices of the Hokkaidō Regional Forest Office, Forestry Agency, MAFF, to the Departments of the Environment of Hokkaidō and Akita Prefectural Governments, to the Tōhoku Regional Environment Office of the Ministry of Environment, and to the Tomakomai Research Forest of Field Science Center for Northern Biosphere, Hokkaidō University, for permission to investigate and collect plant materials.

Endnote

In this report, we adopted the ALA-LC Romanization Tables¹¹⁾ for the transcription of Japanese proper names, except for the names of several bodies.

和文摘要

農業生物資源研究所ジーンバンクと米国農務省研究局との共同事業として、2009年9月7日から25日まで、北海道及び北東北地域の果樹遺伝資源の探索を行った。調査地域の植生は、上部温帯から亜寒帯針葉樹林帯にあたる。主として森林地帯で調査を行ったが、立地条件の特殊な種の探索のため、高山湿原や海岸周辺部も巡った。

この結果、以下の20属53種について計147点を収集した：マタタビ属，ボケ属，ハシバミ属，サンザシ属，ガンコウラン属，アカモノ属，カラハナソウ属，イチゴ属，ウグイスカグラ属，クコ属，リンゴ属，ハッカ属，ウツボグサ属，キジムシロ属，ナシ属，スグリ属，キイチゴ属，ナナカマド属，スノキ属，ブドウ属である。

1) Names followed the list of scientific names in the NIAS genebank. Unlisted names followed "BG Plants - Index of Japanese names and scientific names". 12) When there is a more popular synonym, it is displayed after "=".

2) Japanese plant names were transcribed into single words, without using hyphenation or word division.

Photo 1. *Crataegus chlorosarca*. Nanporo-chō, Hokkaidō Pref.

Photo 2. *Lycium chinense*. Rankochi- chō, Hokkaidō Pref.

Photo 3. *Malus baccata* var. *mandshurica*. Saromachō, Hokkaidō Pref.

Photo 4. *Rubus vernus*. Mt. Chōkai-san, Yurihonjō-shi, Akita Pref.

Photo 5. *Sorbus* × *kawashiroi*. Botanical Gardens of Hokkaidō University, Sapporo-shi, Hokkaidō Pref.

Photo 6. *Pyrus ussuriensis*. Morioka-shi, Iwate Pref.
